LEDiL

Guide for horticultural lighting optics

V1-0 / 2025

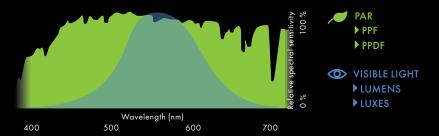

Horticultural lighting in a nutshell

Plants have a completely different sensitivity to light colours. Contrary to other lighting applications which are made for humans and valued in luxes, plants consume light and need photons for photosynthesis. The amount and ratio of different wavelengths from the light determine how, and how fast, plants grow and produce crop.

Regardless of different seasons or unstable weather today's artificially created horticultural lighting can mimic any daylight integral and have stable, optimized growing conditions for each plant.

Some terms to know

The photosynthetic photon flux (PPF), which comes from the total amount of photosynthetically active radiation (PAR), is what has the most effect on how strong plant growth will be. More PPF means more photons and more power, and this value can be easily measured and used as a parallel to lumens. On the other hand photosynthetic flux density (PPFD) means how many of the photons actually hit their target, and this can be related to luxes.

Key design questions

Component	Affecting	Key questions
Leds & driver	PPF Spectral power	Generating enough photons? Correct ratio of photons?
Optics	PPFD (min, max, uniformity)	Are the photons going where they are consumed? Distance required between luminaires? Distance required between luminaire & plants?
All	PPF/J, W/m2, W/kg (efficacy)	How efficient the installation is?

Successful grow light fixture is the sum of it's components

Why LEDiL

Wide range of modular designs available for all types of horticultural lighting.

Efficient single lenses and arrays, IP-solutions, uniform colour mixing and various light distributions

Optimised results with the latest LEDs

Reduced luminaire BOM costs
Use same luminaire design over and over again

Supporting components available from our partners.

Made in collaboration to provide thermally, optically and efficiently optimised off-the-shelf solutions to make your luminaire designs easier. Just add personality.

LED vs HID

Advantages	Disadvantages		
Longer lifetime Expected lifespan after hours of usage	Investment cost 2.0–5.0 times higher		
LED at 25.000 h LED at 50.000 h HID at 20.000 h 50 %	Lower light output Light should be focused only on plants to maximise PPFD		
Less energy/ electricity used (No savings if additional heating is needed) Spectrum optimization Higher yield & Healthier crops	But the right optics can help to Focus light more efficiently Reduce the number of LEDs/ luminaires needed Improve PPFD with less power		
Optimise your system ROI with the right components			

Greenhouse top lighting

Illumination of the hall and plants from ceiling level.

Challenges:

Light concentration on plants

Uniformity and constant quality of light spectrum

High amount of power needed

Typical beams:

BEST MATCH

Vertical farming

Illumination of the plants from above at close distance.

Challenges:

Uniform intensity and spectral distribution

Plants shading each other

Photosynthetic efficiency (PPF/W)

Heat

Typical beams:

Intra-canopy lighting

Illumination on the side or in between the plants.

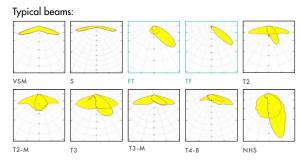

Challenges:

Uniform PPFD

Good color uniformity (if continuous/wide spectrum)

Spectrum fit to the rest of lighting

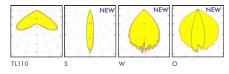

Light direction

DAHLIA

Highly efficient linear platform for horticultural lighting.

Extremely uniform lighting on the growth area resulting in optimal growing conditions

High power density by 120 closely spaced lenses Ingress protection with easy to clean smooth surface Made from PMMA (good chemical resistance)

PPFD deviation 10 % over the growth area

Compatibility: Typical horticultural 3535 HP LEDs
(e.g. Osram Oslon SQ Horti, Luxeon SunPlus 35 Line LEDs)

Simulation results

36 DAHLIA modules in three lines

Distance to tray: 3.2 m

Spacing: 3.1 x 6.8 m

Power: 260 W / module

PPF: 700 µmol/s / module*

Efficacy: 2.69 µmol/J

Results at center tray (width 6.2 m)

Min 36 μ mol/m², Max 39 μ mol/m²

Average PPFD 38 µmol/m²

PPFD uniformity on grow tray 95.3 %

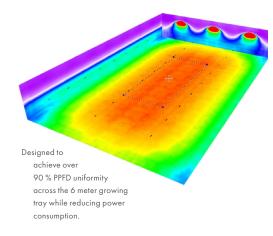

Results at first and last tray

Min 22 µmol/m², Max 38 µmol/m²

Average PPFD 32 µmol/m²

PPFD uniformity on grow tray 67.2~%

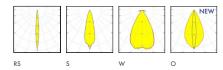

*with red/white LED ration being 3:1

VIOLET

Ingress protected silicone lens array for cost-efficient horticultural and UV disinfection applications.

Simulation results Horticultural lighting with VIOLET and WICOP LEDs

Distance to tray: Number of luminaires: 9 pcs Optics/luminaire: 4 pcs

Uo:

	VIOLET and WICOP LED	WICOP LED only
Average:	258 mW/m^2	119 mW/m ²
Min:	243 mW/m^2	116 mW/m ²
Max:	280 mW/m^2	121 mW/m ²

0.98

0.94

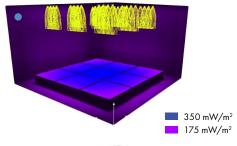

Special silicone grade for high UV transmittance. LEDiL's first UV-C resistant optic.

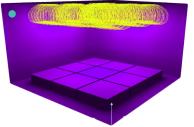

Enables creation of cost-efficient UV solutions with half the dosage time using as few UV LEDs as possible

compared to traditional quartz glass

Can be used with up to 4 LED clusters* for maximum efficiency and output. *Depends on LED

Compatibility: UV LEDs from Seoul Viosys, Nichia

PETUNIA

 29.5×46.5 mm low profile and dense array with 12 lenses for horticultural lighting and up to 3535 size LED packages.

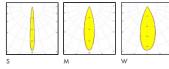

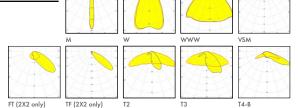

VIRPI

 75×75 mm 25-up multi-lenses for spot- and track lighting and up to 3535 size LED packages.

Standardized modular product families designed for street and industrial lighting, but also suitable for a wide range of other applications.

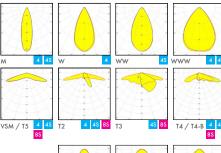

MX/S (STRADA & HB)

90 x 90 mm ingress protected arrays.

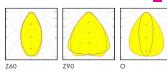

MX: up to 7070 size LED packages MXS: also for up to 9 mm COBs 8MXS: for flat 5050 size LED packages

FLORENCE-3R-IP

3-row (Zhaga book 7) ingress protected linear lenses for humid, wet and dusty environments.

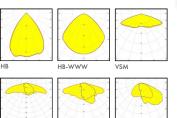

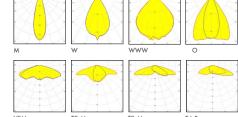

STELLA

Ø90 mm ingress protected silicone lenses for street, wide area and high bay lighting and up to 30 mm LES size COBs.

How to read polar curves

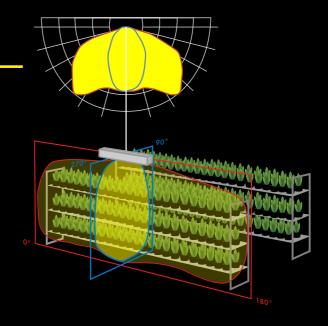

0° to 180°

Longitudinal light distribution

90° to 270°

Horizontal light distribution

The polar curve can be used to estimate optimal beam for installation
